

## ASYMMETRIC ALTERNATING PRISM ARRAYS

## ABSTRACT OF THE DISCLOSURE

A luminaire is provided which includes a light source, a light guide that receives light radiating from the light source, and a plurality of prisms adjacent the light guide that redirect the light from the light guide substantially perpendicular to a longitudinal axis of the light guide. The prism angles, in one embodiment, are  $25^{\circ}$ - $90^{\circ}$ - $65^{\circ}$ . The fine pitch prism arrays preferably alternate or flip-flop every few millimeters, for example, one to two millimeters to create the visual appearance of bright and dark bands which cause the structure to appear like macro prisms.
